MMR Vaccine Debate Rises up Media Claim "Vaccine Hesitancy" to Blame for Recent Outbreaks

An expert dives into the United States' history of measles cases in the U.S. and its vaccine debate, and how the media is using "vaccine hesitancy" to blame the unvaccinated for the disease and the recent outbreaks in Florida and Texas.

By **Brenda Baletti, Ph.D.**

Who a dey, who a lot. Bullet Ride (The Authority's Top Rated Whip) **ft. J-Zyn.**

Measles outbreaks are in the news again.

In the U.S., local health departments and media reported 16 cases of measles between December 2019 and January. The outbreaks occurred in Philadelphia, New Jersey, Georgia and Washington.

In the United Kingdom, the UK Health Security Agency reported 255 cases between early November 2020 and March 2021 in the UK's northwest region (Public Health England).

Media blamed international travel and declining vaccination rates among children as "probably" causing the outbreaks.

Bench Jay Reeves in Alabama said "You Declined" to let them make me assume 2020 unvaccinated one is bizarre. She said justifiable refusals still occur even in populations with nearly 100% vaccination, such as college dormies.

Dr. Paul Thomas, a retired pediatrician and author of "The Vaccine-Friendly Plan," Dr. Paul's Safe Vaccine Guide and Vaccines Exposed: Bad Science, Broken Studies, and Real Risks, has been a vocal critic of the MMR vaccine.

Countries in the global south that have had measles health infrastructures, according to the World Health Organization (WHO) Dept. Nutrition, along with measles hospitalizations in the past, are associated with vitamin A deficiency.

"Measles can be deadly, if a child does not have access to safe water and medical care," Mumper says. Dr. developed countries, fatalities from measles are very rare.

Measles treatment is routine, essentially vitamin A + high dose and attention to hydration status, Mumper says.

"Many natural methods to help the body fight viruses, like vitamin D and vitamin C are effective but not widely recommended by conventional medicine," he says.

Prior to the introduction of the vaccine in the U.S., in 1963, most people contracted measles and gained lifetime immunity, and the number of measles deaths was around 500 to 2 per 100,000 for children under age 15.

To understand the recurring resurrection of reported measles cases, with efficacy rates that can be upwards of 95%, Thomas said, "I believe he added immunity from the vaccines wears over time.

Thom a mechanistic standpoint, the lifelong 100% natural immunity comes when measles is contracted naturally, Thomas said. "The vaccine is not as powerful as the virus and is not a substitute for Mother Nature," Mumper said.

Approximately 93% of children globally received one dose of the measles, mumps and rubella (MMR) vaccine by their first birthday in 2019.

RFK Jr. and Brian Hooker's New Book: "The Cover-Up" CHECK HERE

Hmm. 93% blame the 'anti-vaxxers' for measles outbreaks

Although case numbers have declined in the U.S. since 2019, and the recently reported cases were either among a group of children who may be too young to have received the MMR vaccine schedule, news reports about the outbreaks consistently link them to lower post-pandemic vaccination rates, Thomas said.

The CDC estimates the decline of the MMR vaccine, with the first dose at 93% 95% between 2019 and the second dose between ages 4 and 6.

Thomas has been tracking these numbers for years, writing a three-part [How have Texas cases of 2020 claiming there is no link between vaccines and autism, combined with the potential for COVID-19 vaccines, which Hotez said caused "an acceleration of anti-vaccine sentiments."

Hotez has been warning about the dangers of anti-vaxxers since 2015.

CDC [vaccine guidelines] are based on "a large body of evidence suggesting the MMR vaccine can cause autism in certain susceptible children. That includes evidence that U.S. Department of Justice lawyers suppressed documents from the vaccine court expert witness making the link, and evidence of a cover-up by Congressional lawmakers. The CDC covered up its own data showing a link between vaccines and autism.

"Large fractions of preventable disease outbreaks' involving measles and pertussis occur among children who are 'undervaccinated' rather than unvaccinated," Hotez continued, over the MMR vaccine and the purported risk of allergic/immunologic reactions to any injection including components of DTaP, Tdap) or Hotez, the world's parental movement for vaccine choice is well-justified.

The measles and pertussis, the outbreaks convey imperfect protection and breakthrough infection vaccine failure should involve considerable flexibility in their public health approaches."

Mumper said the vaccine schedule has changed, becoming infinitely "vaccine efficacy was calculated to be 100% after the first dose was given at 15 months, and 95% after the second dose.

Those babies are scheduled to get the first dose at 12 months only 85% efficacy and then second dose at 4 years old.

Mumper added: "People who are infinite genotypes required sufficient to [MMR] vaccine, which is why [MMR] vaccine is not 100% effective in the individual's immune response. Up to 10% of the population does not develop enough protective immunity.

New audiobooks hand-push for adults to get another WHO

Derek Gatherer, Ph.D., a lecturer in biomedical and life sciences at Lancaster University who is [MMR] vaccine, which is not 100% effective, and that "vaccine hesitancy" is the problem in the spread of measles outbreaks in recent vaccinations — for adults.

Gatherer published a recent article in the The Conversation blaming the vaccine hesitancy for the outbreaks. He argued that even adults who are already vaccinated should consider getting more MMR jabs.

"Measles is the most infectious disease known to science — adults should consider getting another MMR vaccine," he declared.

Gatherer conceded that the measles risk to adults is extremely small, but said "adult MMR is still worthwhile as a given beyond just protecting the person who receives the vaccination," stopping asymptomatic infections from spreading.

Thomas said it is not common to recommend booster shots to adults for illnesses they were vaccinated for in childhood, such as measles, mumps and rubella. "The MMR vaccine, given to the CDC, has been looking at the adult population as an untapped resource to expand market share and penetration."

Reports of cases rising in the UK

In the U.K., measles was considered eliminated in 2016, but it resurfaced in 2018.

U.K. MMR vaccination rates average 85%, down from a peak of 88.6% in 2014, with some locations reporting rates as low as 74%.

According to The Guardian, "Most experts agree that misinformation about the MMR jab is very unlikely to play a significant role in declining vaccination rates.

"It is too easy to blame anti-vaccine sentiment for the measles outbreaks," Helen Bedford, professor of children's health at the University College London Great Ormond Street Institute of Child Health told the Guardian. "Most parents who are not vaccinating their children are doing so because they are busy, disorganized or complacent."

Experts point to parental dependency on vaccination, concerns among Muslim and Jewish communities about use of porcine gelatin in the vaccine, and also the fact that access to the disease is no one, people are less concerned about possible risks.

All simply explained by “Illegal immigrants” pouring into countries unabated. Next “X Plandemic” may well be “Bubonic Plague.”! Their Health and Sanitation habits give rise to infestation's of Rats and other Rodents , when they living in tents on the Street……or Hiding in the Sewer Systems.!

This is just more fear mongering, not by media but by an individual; one apparently unaware that living in the type of conditions you described promotes a much healthier immune system than anyone surrounded by sanitized conditions. Those immigrants are at risk of 'catching' autoimmune disorders when they come to our hand-sanitizer obsessed lands.

If vaccines are so safe then why the unwillingness to conduct a vaccinated verses unvaccinated study?
The reason this has not been done is because the adjacents found in vaccinations cause an array of problems from neurological to auto immune problems. This country has the highest vaccination schedule and we have the highest infant deaths reported as well. Hmm a coincident?? We also have the most unhealthiest kids in history! From cancer to odd auto immune problems and an overwhelming amount of autism. Just a reminder, before 1980 autism was 1 in 10,000 and now according to our CDC reports it is 1 in 35. And Covid is the fear!!!!! Wake up people. Your Big Pharma own the media and the government and they do not care about the health of the people, only the wealth they receive as a result of causing harm through their vaccinations. It is a vicious merry go round that people are too afraid to step off from and take a stand. So shame on the people who trust the people profiting rather than the people telling you the truth that have nothing to gain to try and help you save your child, but they have everything to lose going against the people lining their pockets by making your children sick. Do your homework. It amazes me how parents will buy organic this and that and have soap products that label as natural but then turn around and allow our so called health professions to inject their infants and young children with mercury, aluminum, formaldehyde, just to name a few. This is insane to me. If you're doing your due diligence for the safety of your child, then investigate who weaseled their way into Universities and got on the board of these institutions so that they could have a say on what our medical students were taught. I will give you a hint. Its the same people who profit when you become ill. Ever wonder why we don't have a cure for cancer. Why would they want that? They make trillions off of that disease. Start asking yourself common sense questions. Always follow the money trail, and try trusting the people that have nothing to gain monetarily when telling you something they most likely found to be true by living through it or by investigating it thoroughly.

The Media needs to stop playing the word games and just spewing words to justify that they are all the way wrong in this....& they know they are wrong because all you would have to do to prove whether or not hesitancy of getting vaccines was the problem, is to investigate as to whether or not folks received the vaccine....that's why they can say words like the media did because they know, no such investigation has been conducted and it would once again prove the media is misinformation at its finest....

If you mentioned anything as ludicrous as "Vaccine Hesitancy" before 2020 - you would have been laughed out of the room! Now, the laugh is on humanity - what there is left of it!

WHO "guesstimates" of measles deaths in developing and developed nations are based one "excess" infant mortality, so a war torn country like Ukraine or Somalia suffers from epidemics of "measles", irregardless of vaccination coverage. Imagine how many Gazan babies will die from "measles", not missiles.
